

Systematic testing of microsimulation methods

Robin Lovelace (robinlovelace.net)

24/10/2014

Motivation

- ▶ Dozens of methods available for (spatial) microsimulation
- ▶ Difficult to choose from options
- ▶ Testing can be time consuming and tricky (Harland et al. 2012)

Need for fast and consistent testing framework

Broader motivations

Problem: each researcher has their own 'horse' in the race

Past testing efforts in the literature

The 'model experiment' genre

Results from past work

- ▶ Many useful findings - often researcher's own model 'best'
- ▶ No conclusive results - not reproducible - comparing different things

Table 1: Summary comparison of the three algorithms

	Deterministic Reweighting	Conditional Probabilities	Simulated Annealing
Easy setup (is there much pre-processing)?	Yes	Yes	No
Sensitive to specification of constraint order?	Yes	Yes	No
Limit to number of constraints that can be used?	Yes	Yes	No
Requires a sample population?	Yes	No	Yes
Can take forward and backward steps to find an appropriate solution?	No	No	Yes
Stochastic?	No	Yes	Yes
Speed of execution	Fastest	Middle	Slowest

Microsimulation as an experimental procedure

- ▶ Controlled experiments are the foundation of science
- ▶ Real-world experiments impossible
- ▶ Simulation allows range of alternatives to be tested safely

Simulation, then is the process of imitating the behavior of system patterns. Simulation as one method of problem-solving becomes attractive when conventional analytic, numeric or physical experimental methods would be too time-consuming, expensive, difficult, hazardous and/or irreversible or even impossible as real world experiments intended to solve a problem. (Merz, 1991).

International Journal of Forecasting 7 (1991) 77-104 77

IPF performance testing

Setting-up model the experiments

- ▶ 'Scrambled' versions of official datasets used
- ▶ Work ongoing on larger examples

Project organisation

```
-- data-big (just README links)
-- figure
-- input-data
|   |-- sheffield
|   |-- simple
|   `-- small-area-eg
-- literature
-- models
|   |-- ipfinr
|   |-- FMF
|   |-- simSALUD
|   `-- GREGWT
`-- output
```

Try it yourself!

The screenshot shows a web browser window displaying the GitHub repository page for 'Robinlovelace / IPF-performance-testing'. The browser's address bar shows the URL 'https://github.com/Robinlovelace/IPF-performance-testing'. The GitHub navigation bar at the top includes the GitHub logo, a search bar, and links for 'Explore', 'Gist', 'Blog', and 'Help'. The repository name 'Robinlovelace / IPF-performance-testing' is prominently displayed, along with 'Unwatch' and 'Star' buttons. Below the repository name, a description reads: 'Folder for testing the factors affecting the performance Iterative Proportional Fitting procedure — Edit'. A summary bar indicates '140 commits', '2 branches', '0 releases', and '2 contributors'. The main content area shows the 'master' branch selected, with a commit message 'updated loading and reweighting files for microsim' by 'Robinlovelace' from 3 days ago. A file named 'figure' is listed with the commit message 'update for teaching files paper' from 3 days ago. On the right side, a sidebar contains links for 'Code', 'Issues', 'Pull Req', 'Wiki', and 'Pulse'.

Code

Issues

Pull Req

Wiki

Pulse

Replicable results

Reproducible example:

```
source("models/etsim.R")
```

Results

- ▶ 'Empty cells' found to have largest impact on fit
- ▶ **Initial weights had very little impact**
- ▶ C code (**ipfp** package): **50 fold** speed increase

Broadening the tests

CO in FMF vs IPF in R

- ▶ New project to test techniques on very large microdatasets
- ▶ Challenge: allocate 569,741 individuals to 7,787 zones
- ▶ Almost 60 million people in output spatial microdata!
- ▶ New methodology for IPF developed

Microsimulation model user guide

Flexible Modelling Framework

Kirk Harland, TALISMAN node, University of Leeds

External validation

- ▶ More important that 'internal validation' is how well results fit reality
- ▶ Opportunity provided by Census variable on census well-being
- ▶ Simulated at small area level with FMF and R

Work in progress

- ▶ Compare different approaches in terms of timing, model fit and ease of use
- ▶ External validation
- ▶ Use alternative methods to generate same output: GREGWT? SimObesity? simSALUD?

Spatial Microsimulation Modelling for Health Decision Support in Austria

Wider context of spatial microsimulation

Issues within the field

- ▶ “Little attention is paid to the choice of programming language used” for microsimulation (Clarke and Holm 1987)
- ▶ Lack of reproducibility (Lovelace and Ballas 2013)
- ▶ Hard to get started
- ▶ Few simple examples - uses tend to be big and complicated
- ▶ Few introductory teaching resources

Teaching spatial microsimulation

- ▶ Two courses in May (Leeds) and August (Cambridge)
- ▶ Taught basic principles of spatial microsimulation
- ▶ And implementation in R
- ▶ Feedback: students grateful for first rung on ladder
- ▶ More success with latter course focussing on applications

Spatial microsimulation introductory textbook

- ▶ Contract with CRC Press as part of their R Series
- ▶ Draft of book available online in its entirety
- ▶ Open 'wiki' style allows anyone to contribute
- ▶ Any feedback/input gratefully received
- ▶ Check it out here: robinlovelace.net/spatial-microsim-book/

Spatial Microsimulation with R by Robin Lovelace

[Table of contents](#)

Coming soon as
a physical book.

Welcome to the website of *Spatial Microsimulation with R*, a book about modelling individual-level data within administrative zones. The aim is to provide an introduction to the topic, with practical examples implemented in the powerful statistical software R.
